## CD23, B-Cell, (Clone MHM6)

## **Description:**

	Species:	Mouse, Monoclonal.		
	Immunogen:	EBV-transformed B lymphoblastoid cells.		
	Clone:	MHM6.		
	Isotype:	IgG1, Kappa.		
	Format:	This antibody has been pretitered and quality controlled to work on formalin-fixed paraffin-embedded as well as acetone fixed cryostat tissue sections. No further titration is required.		
	Specificity:	In lymphoid tissue, the antibody labels a variable proportion of mantle zone lymphocytes and a fraction of dendritic reticulum cells. In lymph nodes with progressive germinal centre transformation, the number and staining intensity of small follicular lymphocytes are increased. Essentially no staining is seen on splenic marginal zone lymphocytes.		
		The CD23 antigen is expressed on neaoplatic cells from cases of B-Cell chronic lymphocytic leukemia and some cases of centroblastic/centrocytic lymphoma, but not in other types of lymphoid neoplasms.		
		A large number of normal non-lymphoid human tissues do not react with CD23, (Clone MHM6) including: central nervous system, endocrine glands, gastrointestinal, respiratory, urinary, reproductive system, skin, bone, cartilege, connective tissue, muscle, peripheral nerves, vessels, mesothelium, synovium, placente and umbelical cord.		
Uses/Li	mitations:	Immunohistochemistry For Research Use Only. Do not use past expiration date.		
Storage	<b>;</b> :	2-8º Centigrade.		
depending upon the fixation conditions and the staining system employed, op		We suggest an incubation period of 30-60 minutes at room temperature. However, depending upon the fixation conditions and the staining system employed, optimal incubation should be determined by the user. For formalin-fixed paraffin-embedded tissue pretreatment with Citrate Plus (catalog # CPL500) is <b>required</b> .		
Precaut	tions:	Contains Sodium Azide as a preservative. Do not pipette by mouth.
